Materials
For this paper you must have:
• a ruler with millimetre measurements
• a calculator.

Instructions
• Use black ink or black ball-point pen.
• Fill in the boxes at the top of this page.
• Answer all questions.
• You must answer the questions in the spaces provided. Do not write outside the box around each page or on blank pages.
• You may ask for extra paper. Extra paper must be secured to this booklet.
• Do all rough work in this book. Cross through any work you do not want to be marked.

Information
• The maximum mark for this paper is 85.
• The marks for questions are shown in brackets.
• You are expected to use a calculator, where appropriate.
• Quality of Written Communication will be assessed in all answers.
• You will be marked on your ability to:
  – use good English
  – organise information clearly
  – use scientific terminology accurately.

ANSWER IN THE SPACES PROVIDED
2 Haemoglobin is a protein. It is made of two alpha polypeptides and two beta polypeptides. Each alpha polypeptide has 141 amino acids and each beta polypeptide has 146 amino acids.

2 (a) What term is used to describe the structure of a protein made of two or more polypeptides?

[1 mark]

2 (b) Calculate the minimum number of DNA bases needed to code for the number of amino acids in one alpha polypeptide.

Answer = _______________

[1 mark]

2 (c) Describe the role of haemoglobin in supplying oxygen to the tissues of the body.

[2 marks]

______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________

Question 2 continues on the next page
Anaemia is a condition in which there is a decrease in the concentration of haemoglobin in blood. In some people with anaemia, substances are produced which change the oxygen dissociation curve of haemoglobin.

**Figure 2** shows the effect of these substances on the oxygen dissociation curve of haemoglobin.

![Figure 2](image)

2 (d) (i) Use information in **Figure 2** to find the difference in the percentage saturation of haemoglobin with oxygen between a healthy person and a person with anaemia at a partial pressure of oxygen of 4 kPa.

[1 mark]

Answer = ____________
2 (d) (ii) Explain the advantage to a person with anaemia of the change shown in the oxygen dissociation curve.

[3 marks]

______________________________________________________________________________

Turn over for the next question
4 (a) (i) Name the structure through which gases enter and leave the body of an insect.  [1 mark]

______________________________________________________________________________

4 (a) (ii) Name the small tubes that carry gases directly to and from the cells of an insect.  [1 mark]

______________________________________________________________________________

4 (b) Explain the movement of oxygen into the gas exchange system of an insect when it is at rest.  [3 marks]

______________________________________________________________________________

______________________________________________________________________________

______________________________________________________________________________

______________________________________________________________________________

______________________________________________________________________________
Abdominal pumping takes place during vigorous activity in insects. This causes regular squeezing of the tubes of the gas exchange system.

A scientist investigated the effect of abdominal pumping on the pressure in the tubes and the volume of carbon dioxide released by the insect.

Figure 3 shows his results.

Figure 3

![Graph showing pressure in tubes and carbon dioxide release over time with abdominal pumping indicated.]

Describe and explain these results.

[3 marks]

Figure 4 shows three cells, B, C and D, from tissues in the same organism. Each cell is in a stage of either mitosis or meiosis.

**Figure 4**

5 (a) Complete Table 3 with a tick if the cell shows the feature.

[2 marks]

<table>
<thead>
<tr>
<th></th>
<th>Cell B</th>
<th>Cell C</th>
<th>Cell D</th>
</tr>
</thead>
<tbody>
<tr>
<td>homologous chromosomes are present</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>a stage of mitosis</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

5 (b) Describe and explain the appearance of chromosome K in cell C.

[2 marks]
5 (c) Explain what is happening at point J in cell B. [2 marks]

__________________________________________________________________________  
__________________________________________________________________________  
__________________________________________________________________________  

5 (d) Use information from all three cells in Figure 4 to explain how the number of chromosomes in cell D was produced. [1 mark]

__________________________________________________________________________  
__________________________________________________________________________  

5 (e) Figure 5 shows the mass of DNA present in cells of a population of healthy cells where mitosis is occurring.

Figure 5

Mass of DNA in cell / arbitrary units

0 1 2

Number of cells with this mass of DNA

Explain why some cells contain a mass of DNA between 1 and 2 arbitrary units. [1 mark]

__________________________________________________________________________  
__________________________________________________________________________

A scientist examined the structure of mustard plant leaves. He viewed temporary mounts of leaf tissues with an optical microscope. Figure 6 shows a drawing of typical results.

Figure 6

6 (a) Describe how temporary mounts are made. 

[2 marks]
6 (b) Calculate the distance in micrometres between G and H on the leaf. [2 marks]

Answer = ____________ µm

6 (c) Describe how the scientist could have used the temporary mounts of leaves to determine the mean number of chloroplasts in mesophyll cells of a leaf. [3 marks]

______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________

6 (d) There are many different types of cell in a leaf, each with its own function. What term is used to describe a structure such as a leaf? [1 mark]

______________________________________________________________________________

Turn over for the next question
7 (a) What is the name of a position of a gene on a chromosome? [1 mark]

7 (b) What is meant by genetic diversity? [1 mark]

---

A geneticist investigated genetic diversity in four different breeds of dog. She compared DNA base sequences of the same genes from a large number of dogs from each breed.

The geneticist calculated the mean genetic diversity for each breed of dog. The value of this mean was between 0 and 1.

- A mean value of 1 shows maximum genetic diversity.
- A mean value of 0 shows no genetic diversity.

Her results are shown in **Table 4**.

<table>
<thead>
<tr>
<th>Breed of dog</th>
<th>Mean genetic diversity</th>
<th>Standard deviation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Airedale terrier</td>
<td>0.51</td>
<td>± 0.03</td>
</tr>
<tr>

<td>0.38</td>
<td>± 0.02</td>
</tr>
<tr>
<td>Jack Russell terrier</td>
<td>0.76</td>
<td>± 0.01</td>
</tr>
<tr>
<td>Miniature terrier</td>
<td>0.47</td>
<td>± 0.02</td>
</tr>
</tbody>
</table>
7 (c) What do these data show about the differences in genetic diversity between these breeds of dog? [3 marks]

______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________

7 (d) Miniature terriers were first bred from bull terriers in the 19th century.

Suggest one explanation for the observed difference in genetic diversity between miniature terriers and bull terriers. [2 marks]

______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
In mammals, the mesenteric artery connects the aorta to blood vessels of the small intestine.

Sport scientists recorded increases in blood flow in the mesenteric artery after different types of meal. The types of meal were:

- carbohydrate only
- fat only
- protein only.

Typical results are shown in **Table 5**.

<table>
<thead>
<tr>
<th>Type of meal</th>
<th>Maximum percentage increase in blood flow in mesenteric artery</th>
<th>Time taken to reach maximum increase in blood flow in mesenteric artery / minutes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Carbohydrate only</td>
<td>64</td>
<td>15</td>
</tr>
<tr>
<td>Fat only</td>
<td>60</td>
<td>30</td>
</tr>
<tr>
<td>Protein only</td>
<td>57</td>
<td>45</td>
</tr>
</tbody>
</table>

The sport scientists concluded that the three types of meal had no major effect on maximum percentage increase in blood flow in the mesenteric artery.

What else can be concluded from their results?  

[2 marks]

Scientists investigated the presence of bacteria resistant to the antibiotic neomycin in turkeys, chickens and the farmers who kept the turkeys and chickens. They looked for *Escherichia coli* (*E. coli*) resistant to neomycin. At 46 farms, the scientists obtained samples of bacteria from faeces of turkeys, turkey farmers, chickens and chicken farmers. The turkey farmers very often used turkey food containing neomycin. The chicken farmers did not use chicken food containing neomycin very often.

The bacteria were grown on nutrient agar in cultures. The nutrient agar contained neomycin. Any resistant bacteria grew and divided to form visible colonies.

The results are shown in Table 6.

**Table 6**

<table>
<thead>
<tr>
<th>Samples taken from</th>
<th>Percentage of samples of faeces containing <em>E. coli</em> resistant to neomycin</th>
</tr>
</thead>
<tbody>
<tr>
<td>Turkeys</td>
