A-level BIOLOGY

Unit 4 Populations and environment

Thursday 16 June 2016 Afternoon Time allowed: 1 hour 30 minutes

Materials
For this paper you must have:
• a ruler with millimetre measurements
• a calculator.

Instructions
• Use black ink or black ball-point pen.
• Fill in the boxes at the top of this page.
• Answer all questions.
• You must answer the questions in the spaces provided. Do not write outside the box around each page or on blank pages.
• You may ask for extra paper. Extra paper must be secured to this booklet.
• Do all rough work in this book. Cross through any work you do not want to be marked.

Information
• The maximum mark for this paper is 75.
• The marks for questions are shown in brackets.
• You are expected to use a calculator, where appropriate.
• Quality of Written Communication will be assessed in all answers.
• You will be marked on your ability to:
  – use good English
  – organise information clearly
  – use scientific terminology accurately.
1 (a) What term is used to describe populations of different species living in the same habitat? [1 mark]
______________________________________________________________________________

1 (b) Different species occupy different ecological niches. Explain the advantage of species occupying different niches. [1 mark]
______________________________________________________________________________
______________________________________________________________________________

Scientists recorded the number of water beetle species in 30 lakes. In each lake, they measured the pH of the water and recorded whether there were any fish present. 

Figure 1 shows their results.

Figure 1

![Graph showing the relationship between pH and number of water beetle species in lakes with and without fish.](image)
1 (c) A student concluded that a decrease in acidity caused an increase in the number of water beetle species.

Evaluate this conclusion. [3 marks]

______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________

1 (d) Explain how the presence of fish in a lake could cause an increase in the number of water beetle species. [1 mark]

______________________________________________________________________________
______________________________________________________________________________

Turn over for the next question
2 (a)  Where precisely in a cell does the Calvin cycle take place?  

[1 mark]

2 (b)  A scientist investigated the effect of changing the carbon dioxide concentration on the amounts of glycerate-3-phosphate (GP) and ribulose bisphosphate (RuBP) in photosynthesising cells.

Figure 2 shows the results obtained when the carbon dioxide concentration was reduced.

**Figure 2**

![Graph showing the decrease in GP and increase in RuBP with lower CO2 concentration](image)

2 (b) (i)  Explain the decrease in the amount of GP after the carbon dioxide concentration was reduced.  

[1 mark]
2 (b) (ii) The scientist carried out a similar experiment but increased the carbon dioxide concentration from 1% to 2%. The relative amounts of GP and RuBP remained the same.

Suggest two reasons why.

[2 marks]

1

2

2 (c) Some bacteria use hydrogen sulfide, \( \text{H}_2\text{S} \), to produce organic compounds. The hydrogen sulfide has a similar role to that of water in photosynthesis.

A simple equation for this process in bacteria is shown below:

\[
\text{hydrogen sulfide} + \text{carbon dioxide} \rightarrow \text{glucose} + \text{sulfur} + \text{water}
\]

Suggest what the hydrogen sulfide is used for in these bacteria.

[2 marks]

______________________________________________________________________________

______________________________________________________________________________

______________________________________________________________________________

______________________________________________________________________________

Turn over for the next question
3 (a) Explain what is meant by the term phenotype. [2 marks]

______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________

3 (b) One type of colour blindness is controlled by a gene carried on the X chromosome. The allele for this type of colour blindness, b, is recessive to the allele for colour vision, B.

Figure 3 shows the phenotypes in a family tree for this sex-linked condition.

Figure 3

3 (b) (i) Explain one piece of evidence from Figure 3 which shows that colour blindness is recessive. [2 marks]

______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
3 (b) (ii) Give the genotype of individual 8. [1 mark]

3 (c) (i) The allele for tongue-rolling, T, is dominant to the allele for non-tongue rolling, t.

The gene controlling tongue-rolling is not sex-linked. Individuals 10 and 11 are both heterozygous for tongue-rolling.

What is the probability that individuals 10 and 11 will produce a male child who is colour blind and a non-tongue roller? [2 marks]

Answer = _______________

3 (c) (ii) In a population, the frequency of the allele for tongue-rolling, T, is 0.4.

Use the Hardy-Weinberg equation to calculate the percentage of people in this population that are heterozygous for tongue-rolling. [2 marks]

Answer = ________________ %

Turn over for the next question
There are nine subspecies of giraffe. These subspecies evolved when populations of giraffe were separated for long time periods. Each subspecies has distinct coloured skin markings. Some biologists have suggested that up to six of these subspecies should be classified as different species.

4 (a) Explain how different subspecies of giraffe may have evolved from a common ancestor. Use information from the passage in your answer. [5 marks]

______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________

4 (b) Biologists compared the mitochondrial DNA of the different subspecies of giraffe. They used the results from comparing this DNA to conclude that six of the nine subspecies are separate species.

Suggest how they came to this conclusion. [2 marks]

______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
The organic material in household waste can be used to make compost for use as a fertiliser. Scientists investigated changes during one process used to make this compost. The method involved placing the waste in large containers for 150 days. At regular intervals the containers were rotated. The scientists measured the temperature of samples of waste during the investigation.

**Figure 4** shows the results they obtained. The vertical bars show standard deviations.

![Figure 4](image)

5 (a) Explain how microorganisms contributed to the increase in temperature during processing of organic waste.

[2 marks]

______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
5 (b) Explain the advantage of showing the data using standard deviations rather than ranges. [2 marks]

______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________

5 (c) Suggest two advantages of rotating the containers during the process. [2 marks]

1._____________________________________________________________________________

2._____________________________________________________________________________

Question 5 continues on the next page
The scientists took a sample of the waste at the start of the process. They then took samples every 30 days. In each sample, they determined the numbers of particular types of bacteria. Figure 5 shows the changes in the number of three types of bacteria during the process.

**Figure 5**

- **Cocci**
- **Gram positive rods**
- **Gram negative rods**

The scientists concluded that the results in Figure 4 and Figure 5 are evidence for a form of succession during the process.

Use the information to suggest how they reached this conclusion.

[3 marks]
Some plant seeds can respire aerobically and anaerobically. A summary of the process of anaerobic respiration is shown below.

\[
\text{Stage 1} \quad \text{glucose} \rightarrow \text{pyruvate} \rightarrow \text{ethanol and carbon dioxide}
\]

6 (a) (i) Where in a cell does stage 1 occur? [1 mark]

______________________________________________________________________________

6 (a) (ii) Explain how stage 2 enables stage 1 to continue. [2 marks]

______________________________________________________________________________

______________________________________________________________________________

______________________________________________________________________________

______________________________________________________________________________

6 (b) The Respiratory Quotient (RQ) can provide information on the type of respiration taking place in an organism. The following equation is used to calculate the RQ.

\[
\text{RQ} = \frac{\text{volume of carbon dioxide produced during respiration}}{\text{volume of oxygen used during respiration}}
\]

6 (b) (i) What would be the RQ for aerobic respiration of glucose? [1 mark]
6 (b) (ii) A student calculated that the RQ of germinating seeds was 1.8.

Use the information provided to explain this result. [2 marks]
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________

6 (c) Aerobic respiration produces more ATP per molecule of glucose than anaerobic respiration.

Explain why. [2 marks]
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________

Turn over for the next question
Algae are photosynthesising organisms. Some grow on rocky shores. Scientists investigated the abundance of different species of algae at two sites, A and B, on a rocky shore. Site A was on the upper shore and site B was on the lower shore. Figure 6 shows the location of sites A and B on the rocky shore.

Table 1 shows some of the results the scientists obtained.

![Figure 6](image)

### Table 1

<table>

</tbody>
</table>

7 (a) The scientists recorded data from 40 large rocks at each site.

Describe one method that the scientists could have used to ensure that the large rocks were chosen without bias.

[2 marks]
7 (b) The scientists used percentage cover rather than frequency to record the abundance of algae present.

Suggest why. [1 mark]

______________________________________________________________________________

______________________________________________________________________________

7 (c) Apart from availability of water, describe and explain how two abiotic factors may have caused differences in the species of algae growing at sites A and B. [2 marks]

Factor 1 ____________________________________________________________

Explanation ________________________________________________________

______________________________________________________________________________

Factor 2 ____________________________________________________________

Explanation ________________________________________________________

______________________________________________________________________________

7 (d) Use the information provided in Table 1 to explain why the diversity of consumers will be greater at site B. [2 marks]

______________________________________________________________________________

______________________________________________________________________________

______________________________________________________________________________

______________________________________________________________________________

Question 7 continues on the next page
7 (e) The scientists also investigated the algae eaten by two consumers found on the rocky shore, the sea slug and the shore crab. The scientists carried out their investigation in a laboratory.

- They put each consumer into a separate tank through which aerated seawater flowed slowly.
- Each tank contained 5 grams of one species of alga.
- After 50 hours, they measured the mass of the alga remaining in each tank.
- They repeated this procedure several times using a different sea slug and a different shore crab each time.

The scientists then calculated the mean mass of each species of alga eaten by the consumers. They used a statistical test to determine the P value.

Table 2 shows some of the results they obtained.

<table>
<thead>
<tr>
<th>Species of alga</th>
<th>Mean mass eaten / g</th>
<th>P value</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Sea slug</td>
<td>Shore crab</td>
</tr>

<td>0.14</td>
</tr>
<tr>
<td>Cystoseira osmondacea</td>
<td>0.17</td>
<td>0.04</td>
</tr>
</tbody>
</table>

7 (e) (i) The consumers were starved for 5 days before the investigation.

Explain why. [2 marks]

______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
7 (e) (ii) The data in Table 2 for the mean mass of alga eaten were adjusted for loss of mass by the alga due to respiration.

Suggest how the scientists were able to determine the loss of mass due to respiration of a sample of alga.

[3 marks]

______________________________________________________________________________

______________________________________________________________________________

______________________________________________________________________________

______________________________________________________________________________

______________________________________________________________________________

______________________________________________________________________________

7 (e) (iii) Suggest what conclusions the scientists could have made from this investigation when using the probability values in Table 2.

[3 marks]

______________________________________________________________________________

______________________________________________________________________________

______________________________________________________________________________

______________________________________________________________________________

______________________________________________________________________________

______________________________________________________________________________

Turn over for the next question
Crops use light energy to produce photosynthetic products. Describe how crop plants use light energy during the light-dependent reaction. [5 marks]
Describe the advantages and disadvantages of using chemical pesticides to control pests of crops.
